[Suggestion → পাঠ্যপুস্তক দুইটি
Lecture Study করে
একটি Question পাবে]

Flooding

Linked List Routing Protocol (Exercise for Book)

Distance Vector

↳ State information diffusion

↳ DV & LS algorithm comparison

ARP (Address Resolution Protocol)

↑ IP to MAC Mapping

↳ chapter 6

MAC Address

↳ ARP Table

TTL (Time to Live)

{ ARP in action }

WiMax self study

#Distance Vector Example

- All nodes have distance estimates to nearest neighbours (only)

DV in "a": $t=0$

$$D_a(a) = 0$$

$$D_a(b) = 8$$

$$D_a(c) = \infty$$

$$D_a(d) = 1$$

$$D_a(e) = \infty$$

$$D_a(f) = \infty$$

$$D_a(g) = \infty$$

$$D_a(h) = \infty$$

$$D_a(i) = \infty$$

- All nodes send their local distance vector to their neighbours

$t=1$

- receive distance vectors from neighbors
- compute new local distance vector
- send new local DV to neighbours
